## Boost your Workflow

Not everyone name his layers properly.

But if you have that discipline, you can export your assets in seconds. Simply add some characters at the end of your layer names.

Cut&Slice me cuts and exports them in png format trimming the pixels you don't need, or let you can specify the size you want. Or you can export all states of your buttons in the blink of an eye.

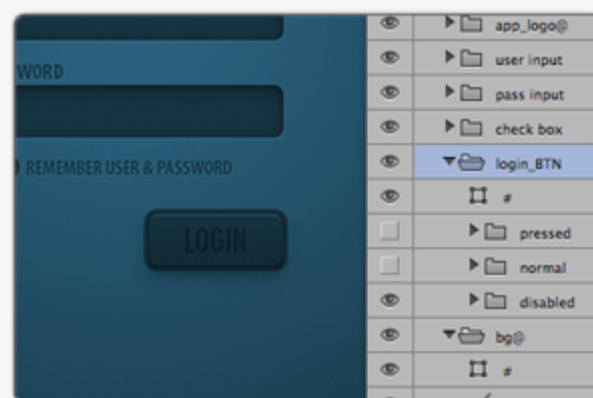

# Forget obsolete Photoshop Slices

Photoshop hasn't change the way it exports for the web since the web was all tables. The Internet has changed. Create overlapping slices exporting only what you need in the minimal time with the maximum detail: no more cut gradients.

We introduce the new slice.

## Export easily your button states

Create many groups as the number of states your button has. *Cut&Slice me* will export them. If you need them to be all the same size, all you need to do is put a rectangular vector with the size you need.

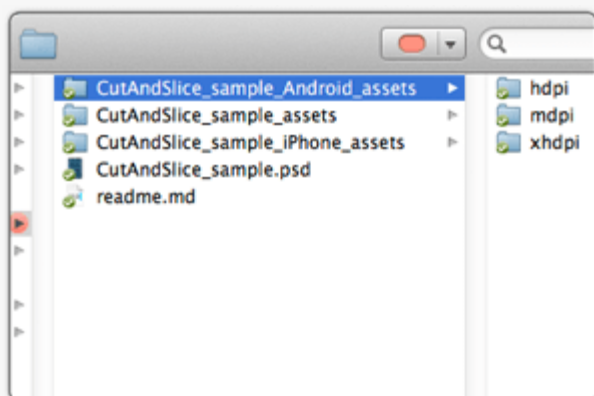

## One Design to rule all resolutions

Design at full resolution and export it to different sizes.

*Cut&Slice me* export to iPhone and Android, also removes all unsupported characters in the file name.

For iPhone design for retina, for Android design for xhdpi and then export to ldpi, mdpi and hdpi with only one click.

# Only some simple rules

Organise your elements in groups, as if they were objects.

Add @ at the end of the layer name you want to export, the content will be exported as a png trimming all transparent pixels.

If you want your file to be a particular size, then create a rectangular vector as first layer and name it #. Your group will be exported at that size.

## BTN

Include "\_BTN" to export all states in your buttons. Add groups containing your button states and name them as follows:

- normal
- hover
- clicked / pressed
- selected
- disabled

## Suggest Ideas

Help me to improve the plugin. Not everyone has the same needs. If you have an idea tell me and maybe it could be included in the next version.

What would you need to improve your workflow?

## Invite me to a cup of coffee (or hire me)

~~No "buy me a coffee" button. If you really want to invite me, email me and let's have that coffee together. (You'll have to come to Tokyo)~~

People keep emailing me asking to put a donate button. I have included it on top. Feel free to donate if you want.

## FAQ

Why only a CS6 version?

I am using the advantages of Flash Builder in plugins creation for Photoshop to have the best performance.
